

Interface Development for digital Financial Reporting

OUR ASSIGNMENT

We developed a new interface for the digital transmission of the "Digitaler Finanzbericht" (German GAAP report). This involved submitting credit and business account information of savings banks' business customers to their tax advisors.

The advisors used this data to create more detailed financial reports, which were then sent back to the savings banks for machine processing in XBRL format. Our goal was to establish automated financial report processing as a standard, replacing traditional PDF and paper reports.

Approach and Tools	Value Realization	aietes Expertise
